Belize Colors

Intro

Belize is a visual theme we provide for SAP Fiori applications, in addition to the standard [Quartz Light theme](#). In SAP Fiori, color communicates importance and association, and provides direction to users.

Color Balance

Color balance refers to the recommended mixture of light and dark, and colored and non-colored areas of any SAP Fiori app interface.

Approaching the ideal color balance for each page creates a visual rhythm throughout the application. It also helps to draw the user's attention to the most important information and functions. Furthermore, it promotes a distinct and consistent look and feel across all SAP Fiori apps.

Color balance (considering dark and light UIs)

Color Usage

Each theme is based on a set of individual base reference values. These are:

- **Primary** (main user interface colors)
- **Secondary** (accent colors)

- **Grayscale** (neutral values)
- **Semantic** (value state colors)

The reference colors listed on this page give a helpful indication as to where they are used in the UI controls and layouts. However, it is extremely important that **reference values are not used directly in the control styling**. The Belize reference color values are specific to this particular theme, but are assigned to control parameters.

The reference colors are used as base values, which are then **distributed into the UI controls via a stable set of theme control parameters that are available in each theme**. Theme control parameters represent semantically named parts of the controls. They are decoupled from the actual color values so that the color values can be easily replaced. [The theming guideline](#) explains how these reference values are mapped to the user interface controls.

Primary Colors

The recommended primary colors leverage the uniqueness of SAP Fiori apps. The primary colors represent the overall look and feel.

SAP Fiori Standard Theme Primary Colors

Primary 1
Global Contrast Base

#3F5161
RGB 63/81/97

Primary 2
Brand / Highlight

#427CAC
RGB 66/124/172

Based on Primary 2
Contrast Highlight

#91C8F6
RGB 145/200/246

Primary 3

RGB 231/236/240

Accent Colors

Accent colors can be applied to accentuate important elements. They make a vivid contribution to the overall UI and should be used sparingly.

#E09D00

RGB 224/157/0

#E6600D

RGB 230/96/13

#C14646

RGB 193/70/70

#925ACE
RGB 146/90/206

#647987
RGB 100/121/135

Grayscale

Grayscale areas play an important role in any SAP Fiori user interface. They minimize the risk of over-stimulation and foster simplicity. White and the light grays are mainly used for areas in the background or for borders. Darker gray shades are primarily used for texts.

Semantic Colors

Semantic colors can be used to represent a negative, critical, positive, neutral, or information status. For more information, see [How To Use Semantic Colors / Industry-Specific Colors](#).

Semantic Colors – Light Flavor Values

Negative

#BB0000
RGB 187/0/0

Critical

#E78C07
RGB 231/140/7

**Positive**

#2B7D2B
RGB 43/125/43

**Neutral**

#5E696E
RGB 94/105/110

**Information**

#427cac
RGB 66/124/172

Semantic Colors – Dark Flavor Values**Negative**

#FF8888
RGB 255/136/136

**Critical**

#FABD64
RGB 250/189/100

**Positive**

#ABE2AB
RGB 171/226/171

Neutral

#D3D7D9
RGB 211/215/217

**Information**

#91c8f6
RGB 145/200/246

Indication Colors

The indication color palette is used to follow the color conventions in a line of business or industry. All values are themeable and the meaning of each color depends on the business context. For more information, see [How To Use Semantic Colors / Industry-Specific Colors](#).
